

PHV / PHK Series Wheel Motors for Track Drives

Features

All-in-one Design

All required components for the track drive are one unit. (Planetary gearbox, hydraulic motor, negative type parking brake, counter balance valve, and optional relief valve)

Compact

The wheel motor can be located within the width of the track.

High Reliability

All parts including the special-made angular ball bearings in gearbox are manufactured and tested by NACHI.

High Efficiency

The axial piston motor can maintain good efficiencies up to high pressure range. It reduces engine stall, and enables better machine maneuverability.

One and Optional Two-speed Function
